

# Version 30 update

# MPanel

The MPanel Pro v30 update is confirmed compatible with AutoCAD 2027 and Rhino8.

Version 30 requires a 64bit CPU and operating system (Windows 7 to 11)

As usual with our annual updates we've added new tools and further improvements to the modelling and panelling functions.

As always, development is driven by requests from you, our users, so if you have ideas which you think would help you and others, we welcome your ideas and suggestions.

## Modeling Tools

Edge bend detection for edge meshes - if selected, you can specify that sudden bends in the edges are detected and have a mesh node on them.

Clamp plate - reinforcement patches now include lines indicating estimated corner reaction angle. Patches also now work with 5 and 6 sided sails.

## Paneling Tools

Corner patch from radius - reinforcement patches now include lines indicating estimated corner reaction angle.

Panels cuff mirror - now works with 3-sided as well as 4-sided panels.

## Other Tools

Export & Import settings - allows user to save MPanel settings to a zip file then import the zip file when transferring MPanel to a new computer.

Plotter settings - for commonly used plotters can now be selected by drop down list.

Extended data - copy to options now copies most of the special settings such as variable warp stress.

We trust you will enjoy these new features and that they will benefit your company.

Thank you for your continued support and again, we encourage you to provide feedback and suggestions for improvements.
